SEE the way the Woods rear springs are mounted-an exclusive, patented, important feature of the car These rear springs don't rest on the axle. They are mounted on "I-beam" radius rods a foot forward of the axle.

These radius rods are attached close to the hubs of the wheels and thus relieve the axle of the weight of the car. They also relieve the springs of the braking and driving strain, preventing pitching of the car when starting or stopping suddenly.

What these radius rods do to sqcrease riding comfort is temark-

shocks 30% before the shocks reach the springs. Then the eight loaf full-elliptic springs take up what's left so the car rides with unequaled smoothness over any road.

This feature of spring suspension is only one of many vitally important details which make the 1915 Woods electric the most comfortable, economical, enduring car you can buy. Call or write for catalog which explains them all and illustrates the new bodies.
